

# Web Services Security XrML Token Binding

## Working Draft 01, 20 September 2002

### Document identifier:

WSS-XrML-01

### Location:

TBD

### Editors:

Phillip Hallam-Baker, VeriSign

Chris Kaler, Microsoft

Ronald Monzillo, Sun

Anthony Nadalin, IBM

### Contributors:

TBD – Revise this list to include WSS TC contributors

Phillip Hallam-Baker, VeriSign

Maryann Hondo, IBM

Chris Kaler, Microsoft

Hiroshi Maruyama, IBM

Anthony Nadalin, IBM

Nataraj Nagaratnam, IBM

Hemma Prafullchandra, VeriSign

John Shewchuk, Microsoft

### Abstract:

This document describes how to use eXtensible Rights Markup Language (XrML) licenses with the **Error! Hyperlink reference not valid.** specification.

### Status:

This is an interim draft. Please send comments to the editors.

Committee members should send comments on this specification to the <mailto:wss@lists.oasis-open.org> list. Others should subscribe to and send comments to the [wss-comment@lists.oasis-open.org](mailto:wss-comment@lists.oasis-open.org) list. To subscribe, visit <http://lists.oasis-open.org/ob/adm.pl>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Security Services TC web page (<http://www.oasis-open.org/who/intellectualproperty.shtml>).

51 **1 Introduction**

52 The [WS-Security](#) specification proposes a standard set of [SOAP](#) extensions that can be used  
53 when building secure Web services to implement message level integrity and confidentiality. This  
54 specification describes the use of eXtensible Rights Markup Language (XrML) licenses with  
55 respect to the [Error! Hyperlink reference not valid.](#) specification.

56 Note that Section 1 is non-normative.

57 **1.1 Goals and Requirements**

58 The goal of this specification is to define the use of SAML assertions in the context of [WS-](#)  
59 [Security](#) including for the purpose of securing [SOAP](#) message exchanges.

60 The requirements to be satisfied by this specification are listed below.

61 **1.1.1 Requirements**

62 TBS

63 ?

64 **1.1.2 Non-Goals**

65 The following topics are outside the scope of this document:

66 ? TBS

67

## 2 Notations and Terminology

68

69 This section specifies the notations, namespaces, and terminology used in this specification.

### 2.1 Notational Conventions

70

71 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",  
72 "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be  
73 interpreted as described in RFC2119.

74 Namespace URIs (of the general form "some-URI") represent some application-dependent or  
75 context-dependent URI as defined in [RFC2396](#).

76 This specification is designed to work with the general [SOAP](#) message structure and message  
77 processing model, and should be applicable to any version of [SOAP](#). The current SOAP 1.2  
78 namespace URI is used herein to provide detailed examples, but there is no intention to limit the  
79 applicability of this specification to a single version of [SOAP](#).

80 Readers are presumed to be familiar with the terms in the [Internet Security Glossary](#).

### 2.2 Namespaces

81

82 The [XML namespace](#) URIs that MUST be used by implementations of this specification are as  
83 follows (note that different elements in this specification are from different namespaces):

84 `http://schemas.xmlsoap.org/ws/2002/xx/secext`  
85 `http://schemas.xmlsoap.org/ws/2002/xx/utility`

86 The following namespaces are used in this document:

87

Prefix	Namespace
S	<a href="http://www.w3.org/2001/12/soap-envelope">http://www.w3.org/2001/12/soap-envelope</a>
ds	<a href="http://www.w3.org/2000/09/xmldsig#">http://www.w3.org/2000/09/xmldsig#</a>
xenc	<a href="http://www.w3.org/2001/04/xmlenc#">http://www.w3.org/2001/04/xmlenc#</a>
wsse	<a href="http://schemas.xmlsoap.org/ws/2002/xx/secext">http://schemas.xmlsoap.org/ws/2002/xx/secext</a>
wsu	<a href="http://schemas.xmlsoap.org/ws/2002/xx/utility">http://schemas.xmlsoap.org/ws/2002/xx/utility</a>
xrml	<a href="http://www.xrml.org/schema/2001/11/xrml2core">http://www.xrml.org/schema/2001/11/xrml2core</a>

### 2.3 Terminology

88

89 This specification employs the terminology defined in the [WS-Security](#) Core Specification.

90 Defined below are the basic definitions for additional terminology used in this specification.

---

## 3 Usage

This section describes the profile (specific mechanisms and procedures) for the SAML binding of [WS-Security](#).

**Identification:** urn:oasis:names:tc:WSS:1.0:bindings:WSS-XrML-binding

**Contact information:** TBD

**Description:** Given below.

**Updates:** None.

### 3.1 Processing Model

The processing model for [WS-Security](#) with XrML licenses is no different from that of [WS-Security](#) with other token formats as described in [WS-Security](#).

### 3.2 Attaching Security Tokens

XrML licenses are attached to SOAP messages using [WS-Security](#) by placing the license element inside the `<wsse:Security>` header. The following example illustrates a SOAP message with an XrML license token.

```
<S:Envelope xmlns:S="...">
  <S:Header>
    <wsse:Security xmlns:wsse="...">
      <xrml:license xmlns:xrml="...">
        ...
      </xrml:license>
      ...
    </wsse:Security>
  </S:Header>
  <S:Body>
    ...
  </S:Body>
</S:Envelope>
```

### 3.3 Identifying and Referencing Security Tokens

The [WS-Security](#) specification defines the `wsu:Id` attribute as the common mechanism for referencing security tokens by "Id" (the specification describes the reasons for this). Since the XrML specification does not allow attribute extensibility on the `<xrml:license>` element, this specification defines a separate mechanism for referencing licenses. The XrML specification allows licenses to be named using a URI with the `licenseId` attribute. Consequently, this specification defines the global namespace qualifier attribute `xmltok:RefType` for use with the `<wsse:Reference>` element (used within a `<wsse:SecurityTokenReference>` element). Using this attribute, references can specify the type of token desired thereby allowing the token-specific matching rules to be processed. Specifically, when the

132 *xmktok:RefType* attribute's value is "xrml:license", then the *URI* attribute refers to  
 133 an <xrml:license> element whose *licenseId* attribute is specified by the URI  
 134 attribute.

135 The following example illustrates a message with an [XML Signature](#) that references  
 136 an XrML token.

```

137 <S:Envelope xmlns:S="...">
138   <S:Header>
139     <wsse:Security xmlns:wsse="...">
140       <xrml:license xmlns:xrml="..."
141         licenseId="urn:SecurityToken-ef375268" />
142       ...
143     </xrml:license>
144     <ds:Signature xmlns:ds="...">
145       ...
146       <ds:KeyInfo>
147         <wsse:SecurityTokenReference>
148           <wsse:Reference URI="urn:SecurityToken-ef375268"
149             xmktok:RefType="xrml:license"
150             xmlns:xmktok="..." />
151         </wsse:SecurityTokenReference>
152       </ds:KeyInfo>
153     </ds:Signature>
154     ...
155   </wsse:Security>
156 </S:Header>
157 <S:Body>
158   ...
159 </S:Body>
160 </S:Envelope>
161
162
  
```

### 163 3.4 Proof-of-Possession of Security Tokens

164 As previously stated, the [WS-Security](#) specification does not dictate how subject  
 165 confirmation must be performed. As well, the XrML specification allows for multiple  
 166 types of confirmation. If a secure transport is not used, it is strongly  
 167 RECOMMENDED that a key-based confirmation mechanism be used.

168 Any processor of XrML security tokens MUST conform to the required validation and  
 169 processing rules defined in the XrML specification.

170 The following table illustrates how several different confirmation mechanisms are  
 171 processed:

Mechanism	RECOMMENDED Processing Rules
<xrml:keyHolder>	The sender (the subject) includes an XML Signature that can be verified with the key information in the referenced security token.
<xrml:allPrincipals>	The sender (the subject) includes an XML Signature that can be verified. An implementation MAY choose to not require

	principals to "authenticate".
--	-------------------------------

## 172 **3.5 Error Codes**

173 When using XrML licenses, it is RECOMMENDED to use the error codes defined in the  
174 [WS-Security](#) specification. However, implementations MAY use custom errors,  
175 defined in private namespaces if they desire. Care should be taken not to introduce  
176 security vulnerabilities in the errors returned.

## 177 **3.6 Threat Model and Countermeasures**

178 The use of XrML licenses with [WS-Security](#) introduces no new threats beyond those  
179 identified for XrML or WS-Security with other types of security tokens.

180 Message alteration and eavesdropping can be addressed by using the integrity and  
181 confidentiality mechanisms described in WS-Security. Replay attacks can be  
182 addressed by using of message timestamps and caching, as well as other  
183 application-specific tracking mechanisms. For XrML licenses ownership is verified by  
184 use of keys, man-in-the-middle attacks are generally mitigated.

185 It is strongly RECOMMENDED that all relevant and immutable message data be  
186 signed.

187 It should be noted that transport-level security MAY be used to protect the message  
188 and the security token.

189 In order to *trust* XML based tokens, they SHOULD be signed using the mechanisms  
190 outlined in [WS-Security](#). This allows readers of XML Tokens to be certain that the  
191 tokens have not been forged or altered in any way. It is strongly RECOMMENDED  
192 that the `<xrml:license>` elements be signed (either within the token, as part of the  
193 message, or both).

---

194 **4 Acknowledgements**

195 This specification was developed as a result of joint work of many individuals from the WSS TC  
196 including:
